

Single D-type Flip-Flop with Set and Reset; Positive Edge Trigger

General Description

The ET74LVC1G74 is a single positive edge triggered D-type flip-flop with individual data (D), clock (CP), set ($\bar{S}D$) and reset ($\bar{R}D$) inputs, and complementary Q and \bar{Q} outputs. Data at the D-input that meets the set-up and hold time requirements on the Low-to-High clock transition will be stored in the flip-flop and appear at the Q output. Inputs can be driven from either 3.3V or 5V devices. This feature allows the use of these devices as translators in mixed 3.3V and 5V environments.

Schmitt trigger action at all inputs makes the circuit tolerant of slower input rise and fall times.

This device is fully specified for partial power down applications using I_{OFF} . The I_{OFF} circuitry disables the output, preventing the potentially damaging back-flow current through the device when it is powered down.
